Analysis Period: 2018-2019. Prepared: March 2026

B2B Software Company. Multi-Warehouse Distribution Model.

Executive Summary

This brief summarises two years of order data across products, warehouses, and time periods. Five critical insights have emerged that require immediate leadership attention.

- **1. The Business is dangerously dependent on one warehouse** (Cedar Park generates 75% of all Revenue).
- **2. Two different customer types are being served without deliberate strategy** (Cedar Park serves high enterprises buying in bulk and Berkely serves smaller businesses buying frequently).
- **3. TBOX is the undisputed top product but its success is concentrated in one location** (TBOX leads in both revenue ($68.96B) and demand company-wide but is nearly invisible at Berkeley warehouse).
- **4. Monday is the strongest sales day and night-time is the dominant ordering period** (Orders peak on Mondays and are largest in volume during night hours).
- **5. Demand patterns show no consistent seasonal trend** (The two years of data show dramatically different patterns. October 2018 recorded 277.57M in demand versus just 42.73M in the same month of 2019(549% difference) suggesting a major one-time event.

Key Findings

Warehouse Performance

Cedar Park handles massive bulk orders from a handful of large enterprise clients. Berkeley handles thousands of smaller orders from a much larger number of smaller businesses. Montcalm and Oakland Mills together account for only 4% of total revenue.

Product Performance

TBOX leads in both revenue ($68.96B) and units demanded making it the company's strongest product overall. However, there are important discrepancies between which products rank highest by revenue versus by demand:

- BI Visualiser ranks 2nd in demand but 11th in revenue- it is a high-volume low-price product.
- VideoRight ranks 3rd in revenue but 5th in demand- it is a high-price low-volume product.
- StorSQL has the highest average order size at Cedar Park but only 314 orders.

This means the company has two distinct product types in its portfolio. Revenue-heavy products like VideoRight and StorSQL depend on a few large orders while demand-heavy products like BI Visualiser have broader but lower-value adoption.

The Two Customer Segments

Cedar Park enterprise clients buy TBOX and StorSQL in enormous quantities. Berkeley clients prefer VideoRight and MindVis in manageable quantities. TBOX which is the top product at Cedar Park is nearly absent at Berkeley, representing an untapped sales opportunity.

Demand & Revenue Trends

The two years show dramatically different patterns making it impossible to confirm seasonal trends with the available data:

- 2018 shows a sharp spike in September (137M) and October (277M) followed by a steep decline.
- 2019 shows a relatively flat pattern that consistently declines from mid-year, ending at just 29.86M in December.

Recommendations

- Investigate the October 2018 spike
- Identify and protect Cedar Park top clients
- Add Customer ID to all future order records
- Launch TBOX at Berkeley
- Invest in Berkely growth
- Review Montcalm and Oakland Mills
- Collect a third year of data before making seasonal plans

Use year slicers to filter the entire dashboard to a specific year. Use Category slicer to filter by product category to see how specific parts of the portfolio are performing.

Charts

Limitations

- No Customer ID- We cannot identify individual customers and measure retention
- No Cost Data- All analysis is based on revenue not profit
- Time Data Reliability- The dominance of night-time ordering for a company distributing physical hardware is unusual and may reflect system recording times rather than order placement time
- Only Two Years of Data- Two years is insufficient to confirm genuine seasonal patterns.
